

Water Security Alert:

WATER DELIVERY SYSTEMS STILL VULNERABLE TO RADIOACTIVE ATTACK.

The pre 9/11 standard of sampling every two years is useless for Homeland Security

PROBLEM: This long detection delay of water system contamination from hazmat accident or terrorist action can allow wide-spread human injury as well as irretrievable contamination to your critical infrastructure causing massive disruption and costing many million dollars to replace.

Technical Associates recognizes the urgency for monitoring our water systems 24/7. TA also knows that in the current economic climate capital investment funding is difficult to obtain and has instituted a deeply discounted price structure for the NEX-BETA instrument. These Beta monitors are priced to be easily available to any water system across the U.S. immediately.

RESOLUTION: This reduced price tag will allow water companies and districts to buy now using discretionary funds. Upgrade later to the more powerful NexGen-SSS system when the budget cycle allows the purchase. TA offers a substantial rebate with a trade in of the NEX-BETA.

The Model NEX-BETA measures only Beta emitters. However it is these Beta emitters such as Cesium-137, Strontium-90, Iodine-131 etc. that pose the greatest risk both in terms of terrorist attack as well as pollution, dumping, or road accidents.

The NEX-BETA can be used as either a continuous 24/7 on-line monitor or as a portable field system for measuring water at various locations.

For specific technical information on the NEX-BETA go to:
